

Play, the flexible selling mechanism that fuels Playmolecule.

Customers all over the world can now buy Play tokens to be used at the Playmolecule platform.

Playmolecule is the platform developed by Acellera to facilitate computational-guided drug discovery. It performs molecular dynamics simulations and machine learning.

Playmolecule's applications simulation have changed the way rational drug discovery is done by combining an innovative simulation and machine learning protocols, adaptive sampling, parametrization tools and deep neural network based predictors.

During these years, many pharmaceutical companies have used, and are using, Playmolecule as part of their R&D programs all over the world. With Play, we provide an easy and more dynamic commercial environment by using a blockchain based system to access innovative technology applied to drug discovery not only for pharmaceutical companies but also for Biotech's.

In addition, by using a decentralized Ethereum Playmolecule's token, we can leverage all the services and absolute security provided by the Ethereum's blockchain ecosystem.

Let's start the conversation
